- Web content should be flexible among devices, but always focus on the device that your target audience is most likely to be using
- Media queries were covered earlier. They allow you to specify CSS rules based on screen size.
- Images can be made responsive to changes in screen size by using the following styling

```
img {  
    max-width: 100%;  
    display: block;  
    height: auto;  
}
```

- To optimize images for high resolution displays, set their length and width to half of their original values
- Text can be made responsive to changes in screen size by using viewport units, which are relative to the screen size (vw, vh, vmin, vmax)
